

Uninterruptible power supply overload protection

Overview

In power systems, overcurrent backup protection methods such as fuses, relays [16,17,18,19], or breakers serve as the primary hardware protection. They are used to isolate the converter from the power transmission line in case of overcurrent [6, 10, 20]. Various switching devices under different working modes can also be protected by hardware protection [21,22,23,24,25,26]. The driver circuit typically incorporates a. According to, an overcurrent control strategy is based on generating new current references based on a current limit function, using an auxiliary control loop, and.
